TriviA AE Scheme

Features of TriviA Possible Proposed Modification of TriviA

TriviA

- SC-TriviA Updated version of Trivium.
- VPV-Hash Universal Hash follows EHC technique.
- SC-TriviA generates encryption and authentication key stream.

SC-TriviA: Underlying Streamcipher VPV Hash Security

KEY INFORMATION OF TRIVIA

- SC-TriviA uses 128-bit key and 128-bit nonce.
- Block Size w 64-bit
- Underlying Field $\mathbb{F}_{2^{32}}$ and $\mathbb{F}_{2^{64}}$
- Encrypts message by One-Time-Pad.
- Intermediate tag Computed after each *ck* blocks.
- Size of each of the tags 128-bit

SC-TriviA: Underlying Streamcipher VPV Hash Security

RECOMMENDED PARAMETER CHOICE

- ck varies from 0 to 2^{30}
- $ck = 0 \Rightarrow$ No intermediate tag.

WE RECOMMEND TWO VERSIONS

- TriviA-0 with ck = 0 and
- TriviA-128 with ck = 128

э

SC-TriviA: Underlying Streamcipher VPV Hash Security

CIRCUIT FOR VPV-HASH

MAIN COMPONENTS OF VPV-HASH

- Two V-Horner circuits (linear) of 64 and 32-bit operations.
- V-Horner basically consists of multiplications by primitive elements.
- One 32-bit field multiplier.

SC-TriviA: Underlying Streamcipher VPV Hash Security

WORK FLOW FOR TRIVIA

SC-TriviA: Underlying Streamcipher VPV Hash Security

WORK FLOW FOR TRIVIA

WORK FLOW

- VPV-Hash processes AD to produce Intermediate data.
- The Intermediate data is XOR-ed with SC-TriviA state.
- SC-TriviA is reinitialized
- Ensures change in AD changes the key stream.

Computation in One Clock-Cycle (64-bit message/AD is processed)

- One 32 bit field multiplier.
- Two V-Horner linear operations.
- SC-TriviA state update and key generation.

SC-TriviA: Underlying Streamcipher VPV Hash Security

SECURITY THEOREMS FOR TRIVIA

Suppose nonce can repeat up to n times. However, nonce together with AD should not repeat.

THEOREM: PRIVACY OF TRIVIA

$$\mathsf{Adv}^{ ext{priv}}_{\mathit{TriviA}}(\mathit{A}) \ \le \ \eta + rac{qn}{2^{160}}.$$

where η denotes the maximum distinguishing advantage over all adversaries *B* making at most σ block queries to Trivia-SC and running in time T_0 (which is about time of the adversary *A* plus some insignificant overhead).

THEOREM: AUTHENTICITY OF TRIVIA

$$\operatorname{Adv}_{\operatorname{TriviA}}^{\operatorname{auth}}(A) \leq \eta + rac{qn}{2^{160}} + rac{q}{2^{126}}.$$

Important Features and Flexibilities of TriviA

(a)

1 TriviA AE Scheme

2 Features of TriviA

B Possible Proposed Modification of TriviA

IMPORTANT PROPERTIES OF TRIVIA

• Presence of Intermediate Tag.

- SC-TriviA Updated design of a well studied and efficient (both in hardware and software) stream cipher Trivium.
- VPV-Hash Low hardware area with minimum multiplications (Nandi, FSE 2014).
- Encryption and authentication key Generated parallelly.
- High bit security- 128-bits for both confidentiality and integrity of plaintext.

1 TriviA AE Scheme

2 Features of TriviA

3 Possible Proposed Modification of TriviA

MOTIVATION

- Construction of an extremely efficient AE scheme for lightweight devices.
- Lower the hardware area.
- Increase the Throughput.

Two Techniques of Updation

- Reduction of blocksize to perform 16-bit field multiplication.
- Removal of the encoding operation from the VPV-Hash.

(人間) (人) (人) (人) (人) (人)

MOTIVATION

• Less hardware area \Rightarrow More efficient in lightweight device.

- Major hardware area taken by VPV-Hash.
- Modification in VPV-Hash.

- 4 同 6 4 日 6 4 日 6

• No Change in SC-TriviA.

REDUCE THE BLOCKSIZE

• Process message in blocks of size 32 bits instead of 64-bits.

- Perform two 16-bit field multiplications instead of one 32-bit multiplication to process 64-bit in a clock cycle.
- The hardware area is reduced (Two 16-bit field multiplier takes less area than one 32-bit).

- 4 同 6 4 日 6 4 日 6

Removal of the Encode Operation

- VPV-Hash uses encode hash and combine technique.
- Removal of the encode operation doesn't change security.
- Decreases the hardware area previously needed for the encoding .
